IN THE CLAIMS

1. (Currently Amended) A positive airway pressure system for treatment of a sleeping disorder in a patient, comprising:

a generator supplying airflow and applying a pressure to an airway of a patient; a sensor measuring data corresponding to patient's breathing patterns; and

a processing arrangement analyzing the breathing patterns to determine whether the breathing patterns are indicative of one of the following patient's states: (i) a regular breathing state, (ii) a sleep disorder breathing state, (iii) a REM sleep state and (iv) a troubled wakefulness state, the processing arrangement adjusting the applied pressure as a function of the patient's state,

wherein, when the breathing patterns indicate one of states (i) and (ii) and (iii), the processing arrangement controls the generator to adjust the pressure to a first value and wherein, when the breathing patterns indicate state (iv), the processing arrangement controls the generator to adjust the pressure to a second value.

2. (Canceled)

- 3. (Original) The system according to claim 1, wherein the sensor measures at least one of an airflow rate and a currently applied pressure.
- 4. (Original) The system according to claim 2, wherein the processing arrangement determines the breathing patterns as a function at least one of the airflow rate and the currently applied pressure.
- 5. (Original) The system according to claim 1, wherein the processing arrangement determines the patient's state as a function of at least one of a patient's blood pressure, a heart rate and EEG data.
- 6. (Original) The system according to claim 3, wherein processing arrangement monitors and

adjusts the airflow and the pressure supplied by the generator until the system is disengaged.

- 7. (Original) The system according to claim 1, further comprising: a mask placed on a face of the patient and covering at least one of the mouth and the nose of the patient.
- 8. (Original) The system according to claim 7, further comprising:
 a tube connecting the mask to the flow generator for supplying the airflow to the patient.
- (Original) The system according to claim 1, further comprising:
 a venting arrangement preventing the patient from rebreathing of the exhaled airflow.
- 10. (Original) The system according to claim 1, wherein the breathing patterns are stored in a database of the processing arrangement, the processing arrangement determining the patient's state as a function of currently detected breathing patterns and previous breathing patterns stored in the database.
- 11. (Original) The system according to claim 1, wherein when the breathing patterns indicate a change from one of states (i), (ii), (iii) to the state (iv), the processing arrangement controls the generator to reduce the pressure.
- 12. (Original) The system according to claim 1, wherein when the breathing patterns indicate a change from state (iv) to one of states (i), (ii) and (iii), the processing arrangement controls the generator to increase the pressure supplied by the generator.
- 13. (Original) The system according to claim 1, wherein when the breathing patterns indicate one of an elevated upper airway resistance, hypopnea and a repetitive obstructive apnea, the processing arrangement controls the generator to increase the pressure supplied by the generator.

- 14. (Original) The system according to claim 1, wherein when the detected breathing pattern is indicative of the state (iii), the processing arrangement controls the generator to maintain a current level of the pressure supplied by the generator.
- 15. (Currently amended) A method for treatment of sleeping disorder in a patient using a positive airway pressure, comprising the steps of:

supplying an airflow to an airway of a patient using a flow generator; measuring data corresponding to the patient's breathing patterns;

analyzing with the processing arrangement the data corresponding to the breathing patterns to determine whether the breathing patterns are indicative of at least one of the following patient states: (i) a regular breathing state, (ii) a sleep disorder breathing state, (iii) a REM sleep state, and (iv) a troubled wakefulness state; [[and]]

using the processing arrangement, controlling the generator to adjust the supplied pressure as a function of the patient's state[[.]]; and

when the breathing patterns indicate one of states (i) and (ii) and (iii), controlling the generator to adjust the supplied pressure to a first value; and

when the breathing patterns indicate state (iv), controlling with the processing arrangement the flow generator to adjust the supplied pressure to a second value.

- 16. (Canceled)
- 17. (Original) The method according to claim 15, wherein the measuring step includes the substep of:

measuring at least one of an airflow rate and an applied pressure using a sensor.

- 18. (Original) The method according to claim 17, wherein the data corresponding to the breathing patterns includes one of the airflow rate and the applied pressure.
- 19. (Original) The method according to claim 15, wherein the analyzing step further includes the

substep of:

determining with the processing arrangement the patient's state as a function of at least one of a patient's blood pressure, a heart rate and EEG data.

- 20. (Original) The method according to claim 15, further comprising the step of: monitoring and adjusting the pressure supplied by the generator until the processing arrangement receives a signal to disengage.
- 21. (Original) The method according to claim 15, further comprising the step of:

 placing a mask on a face of the patient and covering at least one of the mouth and the
 nose of the patient.
- 22. (Original) The method according to claim 21, further comprising the step of: connecting to the mask to the generator using a tube.
- 23. (Original) The method according to claim 15, further comprising the step of:

 providing a venting arrangement to prevent the patient from rebreathing exhaled airflow.
- 24. (Original) The method according to claim 15, further comprising the steps of: storing the breathing patterns of the patent in a database of the processing arrangement; and

determining the patient's state as a function of a current rebreathing pattern and the previous breathing patterns stored in the database.

- 25. (Original) The method according to claim 15, further comprising the step of: controlling the generator to reduce the supplied pressure when the breathing pattern indicates a change from one of the states (i), (ii) & (iii) to the state (iv).
- 26. (Original) The method according to claim 15, further comprising the step of:

controlling the flow generator to increase the supplied pressure when the breathing pattern indicate change from the state (iv) to one of the states (i), (ii) & (iii).

- 27. (Original) The method according to claim 15, further comprising the step of:

 controlling the generator to increase the supplied pressure when the breathing pattern indicates one of an elevated upper airway resistance, hypopnea and a repetitive obstructive apnea.
- 28. (Original) The method according to claim 15, further comprising the step of:
 controlling the generator to maintain the supplied pressure at a current level when the
 breathing pattern indicates the state (iii).
- 29. (New) A positive airway pressure system for treatment of a sleeping disorder in a patient, comprising:
 - a generator supplying airflow and applying a pressure to an airway of a patient;
 - a sensor measuring data corresponding to patient's breathing patterns; and
- a processing arrangement analyzing the breathing patterns to determine whether the breathing patterns are indicative of the following patient's states: (i) a regular breathing state, (ii) a sleep disorder breathing state, and one of (iii) a REM sleep state and (iv) a troubled wakefulness state.
- 30. (New) A method for treatment of sleeping disorder in a patient using a positive airway pressure, comprising the steps of:

supplying an airflow to an airway of a patient using a flow generator;
measuring data corresponding to the patient's breathing patterns; and
analyzing with the processing arrangement the data corresponding to the breathing
patterns to determine whether the breathing patterns are indicative of the following patient states:
(i) a regular breathing state, (ii) a sleep disorder breathing state, and one of (iii) a REM sleep
state and (iv) a troubled wakefulness state.

- 31. (New) A positive airway pressure system for treatment of a sleeping disorder in a patient, comprising:
 - a generator supplying airflow and applying a pressure to an airway of a patient;
 - a sensor measuring data corresponding to patient's breathing patterns; and
- a processing arrangement determining whether the breathing patterns are indicative of a troubled wakefulness state, the processing arrangement adjusting the applied pressure as a function of the state.
- 32. (New) A method for treatment of sleeping disorder in a patient using a positive airway pressure, comprising the steps of:

supplying an airflow to an airway of a patient using a flow generator;
measuring data corresponding to the patient's breathing patterns; and
determining, based on the data, whether the breathing patterns are indicative of a troubled
wakefulness state, and

adjusting the airflow based on the state.
